p. 75-77.

Curves were obtained for the radio brightness distribution in the equatorial and polar regions at 50 cm, and in the equatorial region at 1m. A brightening of about 60% in relation to the Sun's centre was detected at 50 cm with a peak intensity at a distance of $0.65R_{\odot}$. In the polar region the brightening was less pronounced. The brightening was shifted towards the centre, it was not at the limb. In its form, the radio Sun is similar to an ellipse. It is slightly flattened in the polar region. The brightening was not detected at 1m. Results obtained agree with the theoretical ideas on the distribution of temperature and density in the corona, and with the experimental (Astronomy--Astrophysics, TT, v. 5, no. 11) (over)

DESCRIPTORS: *Paper, *Synthetic fibers, Processing,
*Wood pulp fibers, *Paper industry, Ball mills, *Vinyl
radicals, *Acetates, Mechanical properties, *Rayon
fibers.

Prior to the mixed-beating of bleached kraft pulp and
Vinylon, Vinylon fibre was beaten in a mortar and a
ball-mill, and the possibility of fibrillation of vinyl
fibre was ascertained. An observation of the behav-
iour in the beater of mixed samples of bleached kraft
